2. Project Title and Description

Project Title: Grand Exchange Strategy Backtester

Project Description: A web application that lets Old School RuneScape players test trading strategies against real historical Grand Exchange data. The user defines a trading rule (conditions for buying and selling based on price, margin, and volume), and the application reports how that strategy would have performed. Existing tools tell players what to buy right now; RuneReport answers "would this strategy have worked?"

3. Accomplishments and overall project status during this increment

During this increment, we focused on implementing the front end of the project using a top-down development approach. We created the overall structure and visual design of the website, including a home page, NavBar, search functions, item display layouts, strategy reports, and other page layouts. We also implemented styling elements unique to RuneScape across the application; this includes RuneScape-style font and color choices. We also added interactive elements that deal with page and item movement between pages, such as making items clickable and correct NavBar links to pages. At the current stage, these implementations are primarily placeholders that establish the user interface and help highlight exact future functionality. Overall, the project is progressing smoothly. Our main objective this increment was to establish the front-end look and to put placeholders in place for future functionality. Compared to our original proposal, the core pages and navigation are in place; the strategy engine, live API data, and report generation are still to be built.

4. Challenges, changes in the plan and scope of the project and things that went wrong during this increment

Throughout Increment 1, we ran into a few challenges concerning team coordination and clashing visions for the project. Although everyone did their part well during this increment, it was difficult to establish a general consensus on how the features of our project would work. For instance, several of us had differing ideas for how and where the strategy tester would be implemented. This led to some confusion among the team and made it difficult to move forward with new issues. To address this, we held Discord meetings as needed and used the team group chat to clear up any confusion between

members. In terms of scope, we did not have to narrow much, as our initial plan already started relatively small. That said, since we have only worked on the front end so far, we may have to cut some features in future increments if they prove more time-consuming than anticipated. Overall, the team worked through these challenges very well, and every member actively participated during the first increment.

5. Team Member Contribution for this increment

a. the progress report

Miles Burkart: N/A

Colton Bregoff: Question 4

William Kilduff: Questions 3 and 7

Agustin Camus: Question 5, revised Questions 2, 3, 6, and 7.

Ricardo Furst: N/A

b. the requirements and design document

Miles Burkart: N/A

Colton Bregoff: Question 2

William Kilduff: Question 1, 4, and part of 7

Agustin Camus: Revised Question 1, 6, and 7.

Ricardo Furst: Questions 3 and 6

c. the implementation and testing document

Miles Burkart: N/A

Colton Bregoff: N/A

William Kilduff: N/A

Agustin Camus: Wrote sections 1 & 2, added placeholders for 3-5.

Ricardo Furst: N/A

d. the source code

Miles Burkart: Item browsing page, page styling

Colton Bregoff: Navbar design and links, current page navbar tracking, save and generate report buttons, and browse all items button

William Kilduff: Saved Reports, Item links, fonts, bugfixes

Agustin Camus: shared navbar, item report inputs, most traded list, browse item cards clickable, bugfixes

Ricardo Furst: blueprint pages (individual items / all items / report page), and homepage search bar

e. the video or presentation

Miles Burkart: Browse page

Colton Bregoff: Navbar design, navbar links, save and generate report buttons

William Kilduff: Intro, Saved Reports, and item links

Agustin Camus: shared navbar, item report inputs, most traded list, browse item cards clickable, bugfixes

Ricardo Furst: Blueprint pages, search bar, placeholder report page, outro

6. Plans for the next increment

For the next increment, we plan to connect our existing pages to live data from the OSRS Wiki Real-time Prices API and to build the strategy engine in client-side JavaScript. We will focus first on item search, the Most Traded list, and item pages, then on the Report Settings inputs feeding the engine to generate reports. We will keep building on the existing front-end, replacing placeholders with working features one at a time. By the next increment, we expect the main features of the website to be functional in some capacity.

7. Stakeholder Communication

RuneReport project update – First Increment

Hello,

I wanted to provide an update on the progress of RuneReport, the web application designed to help Old School RuneScape players test trading strategies against historical Grand Exchange prices and review how those strategies would have performed.

For our first development increment, we focused on building the frontend using a top-down development approach. We created the main website structure, interface, individual item, search, navigation, and saved reports systems. These components establish the overall look, layout, and user experience of the application. The core screens are in place, and the basic experience of walking through the application should remain close to what it is today.

As is common early in a software project, we spent part of this period aligning on exactly how the core strategy-testing feature should work before building around it. Settling this up front means the remaining work is better defined.

At this point, the frontend provides the foundation and pre-look into the features we are going to implement. The information and interactions are currently placeholders, since we are focusing on establishing the interface before connecting to the application's underlying data and functionality.

For the next increment, we will begin connecting the interface to live market data and implement the functionality behind it. This will include working with 3rd-party item data to allow for searching, generating reports, and saving reports for those items.

We will continue to build on the existing interface continuously as we move toward completing the product.

Best Regards,
RuneReport Team
